

Sparkling Clean

University Cleaning Inventory & Issuance System PRG381 Group Project, Group 3

Sparkling Clean is our Track B submission for the PRG381 Project.

It's a Java Swing desktop app that lets university staff manage cleaning materials, suppliers, cleaners, and stock issuances. Built to meet the assignment's required modules (authentication, dashboard, CRUD, stock issuance, reports, and role-based access).

Package Breakdown

Package / Folder	Purpose
view	Top-level Swing frames (LoginFrame , RegisterFrame , MainFrame) that manage application startup, authentication screens, and the main layout shell with sidebar navigation.

Package / Folder	Purpose
<code>view.panels</code>	Embedded <code>JPanel</code> components swapped inside <code>MainFrame</code> 's main layout (<code>DashboardPnl</code> , <code>MaterialsPnl</code> , <code>SuppliersPnl</code> , <code>CleanersPnl</code> , <code>StockIssuancePnl</code> , <code>ReportsPnl</code>). Each panel presents the actual screen for that page.
<code>view.popUpDialogs</code>	Modal GUI dialogs (<code>JDialog</code>) used for creating and editing records (<code>AddCleanersDialog</code> , <code>EditSuppliersDialog</code> , <code>AddStockIssuanceDialog</code> , etc.) without navigating away from the active panel.
<code>controller</code>	Application controllers containing business logic and intermediary validation between the presentation views (<code>view</code>) and data persistence layer (<code>dao</code>).
<code>dao</code>	Data Access Object layer (<code>CleanerDAO</code> , <code>SupplierDAO</code> , <code>ReportsDAO</code> , <code>UserDAO</code> , etc.) encapsulating raw SQL queries and database CRUD operations.
<code>model</code>	Model classes (<code>Cleaner</code> , <code>Material</code> , <code>Supplier</code> , <code>StockIssuance</code> , <code>User</code>) mapping database tables to structured Java objects.
<code>services</code>	Service layer components handling higher-level business rules and orchestration across DAO operations (e.g., <code>CleanerService</code> , <code>SupplierService</code>).
<code>utils</code>	Shared helper utilities: <code>DBConnection</code> for centralized JDBC connectivity, <code>PasswordUtil</code> for secure hashing, <code>CurrentUser</code> for session and role state tracking, and <code>AlertUtils</code> / <code>uiUtilities</code> for UI styling and notifications.
<code>database</code>	Storage for system database artifacts, including the ER Diagram (<code>ERD.jpeg</code>) and initialization scripts (<code>schema_with_mockdata.sql</code>).
<code>nbproject</code>	Auto-generated NetBeans project configuration and build metadata.

How the UI fits together

The application is built around three top-level `JFrame` components in `ui/`:

1. `LoginFrame`, the application's entry point (`main.class`). Handles staff login and links to registration.
2. `RegisterFrame`, handles new staff member registration.
3. `MainFrame`, loaded after a successful login. This is the main application window.

`MainFrame` is split into two areas:

- A left-hand sidebar with the logo, navigation buttons (Dashboard, Materials, Suppliers, Cleaners, Stock Issuance, Reports), and logged-in user info.
- A right-hand content area (`contentPanel`), a `CardLayout` container that swaps between the six `JPanel` forms in `ui/panels/`, depending on which sidebar button is clicked.

Each panel in `ui/panels/` is a self-contained `JPanel` responsible for one module's CRUD screen and logic (e.g. `MaterialsPnl` handles adding, editing, and deleting cleaning materials), which keeps `MainFrame` itself focused purely on layout and navigation.

Role-Based Access Control

There are three roles: Owner, Storekeeper, and Cleaner.

Which sidebar buttons appear and which page actions are enabled depend entirely on the role of the currently logged-in staff member.

The mock data (loaded via the SQL script in [Database Setup](#)) includes a ready-to-use login for each role, see the credentials table in the [Running the project](#) section to try each role out.

How role-based access is implemented

`src/utils/CurrentUser.java` keeps track of whoever is currently logged in and offers simple yes/no checks for their role:

```
public class CurrentUser {
    public static final String ROLE_CLEANER = "Cleaner";
    public static final String ROLE_STOREKEEPER = "Storekeeper";
    public static final String ROLE_OWNER = "Owner";
    private static User loggedInUser;

    private CurrentUser() {
    }

    public static void set(User user) {
        loggedInUser = user;
    }

    public static void clear() {
        loggedInUser = null;
    }

    public static User get() {
        return loggedInUser;
    }

    public static boolean isLoggedIn() {
        return loggedInUser != null;
    }

    public static boolean hasRole(String role) {
        return loggedInUser != null &&
        loggedInUser.getRole().equalsIgnoreCase(role);
    }

    public static boolean isCleaner() {
        return hasRole(ROLE_CLEANER);
    }

    public static boolean isStorekeeper() {
        return hasRole(ROLE_STOREKEEPER);
    }
}
```

```

    public static boolean isOwner() {
        return hasRole(ROLE_OWNER);
    }
}

```

Each panel uses these checks to decide what to show. There are two patterns depending on the page:

1. **Dashboard and Reports**, Owner and Storekeeper see exactly the same thing here (full access, no restrictions), so these two panels don't need any role checks at all. The Cleaner never sees these pages because the sidebar itself doesn't show Dashboard or Reports buttons for that role, so there's nothing to restrict once you're on them.
2. **Materials, Suppliers, Cleaners, Stock Issuance**, access differs between roles on these pages, so each of these panels calls its own `applyRoleRestrictions()` method right after `initComponents()` in its constructor. This method checks the role and then hides or disables whatever that role isn't allowed to use. For example, in `CleanersPnl`, only the Storekeeper can add, edit, or delete, so the Owner gets the "Add Cleaner" button hidden and the Edit/Delete table columns removed entirely:

```

public CleanersPnl() {
    initComponents();
    applyRoleRestrictions();
}

private void applyRoleRestrictions() {
    boolean canEdit = CurrentUser.isStorekeeper();

    btnAddCleaner.setEnabled(canEdit);
    btnAddCleaner.setVisible(canEdit);

    if (!canEdit) {
        javax.swing.table.TableColumnModel columnModel = jTable1.getColumnModel();
        columnModel.removeColumn(jTable1.getColumnModel().getColumn("Edit"));
        columnModel.removeColumn(jTable1.getColumnModel().getColumn("Delete"));
    }
}

```

Every other CRUD panel follows this same type of pattern. A role never sees a control it isn't allowed to use: buttons are disabled and set to not visible, and columns are removed outright, not just greyed out.

The screenshots under each role below show what these restrictions look like side by side, compare the same page across roles to see which buttons/columns disappear.

Owner

Starting screen: **A blank pannel, user must choose a option to navigate to**

Module	Access
Dashboard	Full view

Module	Access
Materials	View only
Suppliers	Create, Read, Update, Delete
Cleaners	View only
Stock Issuance	View only
Reports	Full access

The Owner's sidebar shows all modules. Dashboard and Reports are identical to what the Storekeeper sees (no restrictions on either role there); the difference between the two roles shows up on Materials, Suppliers, Cleaners, and Stock Issuance, where the Owner is read-only everywhere except Suppliers.

Login And Register Screenshots

Login Screen

The image shows a web browser window with the title "Sparkling Clean". The page has a solid blue background. At the top center, the text "Sparkling Clean" is displayed in a large, white, sans-serif font. Below it, in a smaller white font, is the subtitle "Cleaning Supplies Managment". In the center of the page is a white rectangular box containing the "Sign In" form. The form has the title "Sign In" in bold black text. Below the title are two input fields: "Email" and "Password". The "Email" field contains a single vertical line cursor. Below the "Password" field is a blue button with the text "Sign In" in white. At the bottom of the white box, there is a horizontal line, followed by the text "Don't have an account?" and a blue link "Register here".

Register Screen

A screenshot of a web browser window displaying the 'Sparkling Clean' application. The browser's title bar shows the application name and standard window controls. The page has a solid blue background. At the top center, the text 'Sparkling Clean' is displayed in a large, white, sans-serif font, with 'Cleaning Supplies Management' in a smaller white font directly below it. Centered on the page is a white rectangular form titled 'Register' in bold black text. The form contains several input fields: 'Full Name' (a text box with a vertical cursor), 'Username' (a text box), 'Email' (a text box), 'Role' (a dropdown menu with 'Cleaner' selected), 'Password' (a text box), and 'Confirm Password' (a text box). Below these fields is a blue button with the text 'Create Account' in white. At the bottom of the form, there is a link that reads '<- Back to Sign In' in blue text.

Role-specific page screenshots (Dashboard, Materials, Suppliers, Cleaners, Stock Issuance, Reports) are shown under each role in the [Role-Based Access Control](#) section above, since each role sees a different starting screen and a different level of access on shared pages.

Database Schema (ERD)

The diagram below shows how the core tables (users, suppliers, materials, cleaners, stock_issuances) relate to one another.

Security

Passwords are never stored in plaintext. When a staff member registers or logs in, their password is hashed using SHA-256 and stored, via `src/utils/PasswordUtil.java`:

- `PasswordUtil.hash(password)`, hashes a plaintext password into its SHA-256 hex digest before it is stored (on registration) or compared (on login).
- `PasswordUtil.verify(password, storedHash)`, re-hashes an entered password and compares it against the stored hash, returning `true/false` without ever decrypting anything (SHA-256 is one-way).

```

public static String hash(String password) throws Exception {
    MessageDigest digest = MessageDigest.getInstance("SHA-256");
    byte[] encodedHash = digest.digest(password.getBytes(StandardCharsets.UTF_8));
    return bytesToHex(encodedHash);
}

public static boolean verify(String password, String storedHash) throws Exception
{
    return hash(password).equals(storedHash);
}
  
```

Note: this implementation hashes without a salt, so it's a simpler approach that is easier to implement.

The seeded login passwords shown elsewhere in this README (e.g. `Password@1234`) are the plaintext passwords you type into the login screen, the database only ever stores their SHA-256 hash.

Getting Started

Prerequisites

- **Windows**, this project is developed and tested on Windows; other operating systems are not officially supported
- **JDK 26**

- **Apache NetBeans 30** (the project uses NetBeans project files, so NetBeans is recommended over other IDEs)
- **PostgreSQL 18** (latest stable release), this project is configured for a local PostgreSQL setup only (no remote/cloud database support), so make sure PostgreSQL is installed and running on your own machine
- The **PostgreSQL JDBC driver** (`.jar`), see [Adding the PostgreSQL JDBC Driver](#) below

Installation

1. Go to the repository's GitHub page.
2. Click the green **Code** button, then **Download ZIP** (this downloads the `main` branch).
3. Extract the downloaded ZIP file to a folder on your computer.
4. Continue with the Database Setup and Opening the Project in NetBeans sections below.

Database Setup

This project uses a local PostgreSQL setup only, it does not support connecting to a remote or cloud-hosted database. You must install PostgreSQL on your own machine and create the database locally before running the app.

1. Install PostgreSQL if you haven't already, and make sure the PostgreSQL service is running.
2. Open pgAdmin and connect to your local PostgreSQL server.
3. In the left-hand tree, right-click on **Databases**, then select **Create** → **Database...**
4. In the dialog that opens, set the Database name to `sparkling_clean` (matching the name expected in `DBConnection.java`, see step 6 below), then click **Save**.
5. Run the project's SQL script against the new database to create the tables and load the mock/seed data. (Can be found at : PRG381_Project_PTA381_AM_Group-3\University Cleaning Inventory And Issuance System\database\schema_with_mockdata.sql)
 - In pgAdmin: right-click the `sparkling_clean` database → **Query Tool**, then open the `.sql` file (**File** → **Open...** within the Query Tool) and click **Execute/Run**.
 - Alternatively, from a terminal:

```
psql -U postgres -d sparkling_clean -f db/sparkling_clean.sql
```

This single script creates all required tables (users, suppliers, materials, cleaners, stock_issuances) and inserts the mock data used for testing (sample materials, suppliers, cleaners, and a default login for each role).

Once the script has run, you can log in with one of these seeded accounts to explore each role:

Role	Email	Password
Owner	<code>owner@example.com</code>	<code>Password@1234</code>

Role	Email	Password
Storekeeper	storekeeper@example.com	Password@1234
Cleaner	cleaner@example.com	Password@1234

6. Edit `src/utils/DBConnection.java` to match your local PostgreSQL setup. This is the file the app uses to connect to the database, so it must reflect the database name, username, and password you actually created:

```
package utils;

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

public class DBConnection {
    // PostgreSQL JDBC driver class
    private static final String DRIVER = "org.postgresql.Driver";
    // JDBC URL to connect to the local PostgreSQL server + database
    private static final String JDBC_URL =
        "jdbc:postgresql://localhost:5432/sparkling_clean";
    // PostgreSQL local username and password required to access PostgreSQL
    private static final String USER = "postgres";
    private static final String PASSWORD = "password";

    public DBConnection() {
    }

    // Create a connection to the database
    public static Connection getConnection() throws ClassNotFoundException {
        Connection con = null;
        try {
            // Dynamically load the JDBC driver class at runtime
            Class.forName(DRIVER);
            con = DriverManager.getConnection(JDBC_URL, USER, PASSWORD);
            if (con != null) {
                System.out.println("Connected to database");
            }
        } catch (SQLException ex) {
            ex.printStackTrace();
        }
        return con;
    }
}
```

Update these three values to match what you configured in step 2:

Field	What to change it to
JDBC_URL	<code>jdbc:postgresql://localhost:<port>/<your_database_name></code> , keep <code>localhost</code> since this project only supports a local database; just update the port (if you changed it during install) and the database name if it differs from <code>sparkling_clean</code>
USER	The PostgreSQL username you connect with (default install often uses <code>postgres</code>)
PASSWORD	The password you set for that PostgreSQL user during installation

Without this step, the app will fail to connect and you'll see errors.

Opening the Project in NetBeans

1. Open Apache NetBeans.
2. Go to **File** → **Open Project...**
3. Browse to the folder where you extracted the ZIP file and select the project folder (the one containing `nbproject/` and `build.xml`).
4. Click **Open Project**.
5. Wait for NetBeans to index the project. If you see a red exclamation mark on the project name, see [Fixing JDK Version Errors](#) below.

Running the project

1. Make sure PostgreSQL is running and the database/tables/seed data are set up (see Database Setup above).
2. In NetBeans, right-click the project and select **Run**.
3. The `LoginFrame` should appear as the entry point, log in with one of the seeded accounts below (or register a new account) to continue:

Role	Email	Password
Owner	<code>owner@example.com</code>	<code>Password@1234</code>
Storekeeper	<code>storekeeper@example.com</code>	<code>Password@1234</code>
Cleaner	<code>cleaner@example.com</code>	<code>Password@1234</code>

Resolving Errors

1. Adding the PostgreSQL JDBC Driver (By default it should be there)

The project needs the PostgreSQL JDBC driver (`postgresql-<version>.jar`) on its classpath to connect to the database. This should already be added and should not be needed but if the problem does occur here is what to do:

1. Download the driver `.jar` from jdbc.postgresql.org if you don't already have it.
2. In NetBeans, expand the project and right-click on **Libraries**.
3. Select **Add JAR/Folder...**

4. Browse to and select the downloaded `postgresql-<version>.jar` file.
 5. Click **Open**; the driver should now appear under Libraries in the project tree.
 6. Clean and build the project to confirm it compiles (right-click the project → **Clean and Build**).
-

2. Fixing JDK Version Errors in NetBeans

This project targets JDK 26. If NetBeans shows the project with a red marker or "missing JDK" / "invalid source/target release" type errors, it usually means the JDK configured on your machine doesn't match JDK 26.

What appears when the target JDK version or PostgreSQL JDBC driver is missing or misconfigured.

1. Right-click the project → **Properties**.
2. Go to **Sources**, and check the **Source/Binary Format** field, noting the Java version listed.
3. Go to **Libraries** → **Java Platform**, and check which JDK is selected.
4. If the required JDK isn't installed or listed:
 - Download and install the matching JDK version from [Adoptium](#) or [Oracle](#).
 - In NetBeans, go to **Tools** → **Java Platforms** → **Add Platform...** and point it to your new JDK installation folder.
5. Back in **Project Properties** → **Libraries**, select the correct Java Platform from the dropdown.
6. Apply changes, then **Clean and Build** the project again.

Reference view of what your Libraries / Java Platform configuration should look like once setup is correct.

3. Troubleshooting Common Setup & Runtime Issues

If something isn't working, check the reference screenshots below against what you are seeing—they cover the most common database setup and login authentication issues.

Database Setup Errors

- **Database Not Created in pgAdmin** *What you'll see if the `sparkling_clean` database was never created in pgAdmin.*

Contributors & Code Attribution

- **Waldo Blom** - 578068
- **Contribution:**
 - Created the initial UI shell & navigation for the entire application using NetBeans GUI Builder
 - Login and Register functionality ([LoginFrame.java](#), [RegisterFrame.java](#), [AuthController.java](#), [UserDAO.java](#))
 - User authentication and session management ([PasswordUtil.java](#), [CurrentUser.java](#), [User.java](#))
 - Reports screen functionality implemented ([ReportsPnl.java](#), [ReportsDAO.java](#))
- **Tobie Jansen van Vuuren** - 602050
- **Contribution:**
 - Dashboard screen functionality ([DashboardPnl.java](#))
 - Materials screen functionality ([MaterialsPnl.java](#), [MaterialDAOInterface.java](#), [Material.java](#), [AddMaterialDialog.java](#))
- **Arnold Mabope** - 603261
- **Contribution:**
 - Suppliers screen functionality ([SuppliersPnl.java](#), [SupplierController.java](#), [SupplierService.java](#), [SupplierDAO.java](#), [Supplier.java](#), [AddSuppliersDialog.java](#),

EditSuppliersDialog.java)

- Cleaners screen functionality (CleanersPnl.java, CleanerController.java, CleanerService.java, CleanerDAO.java, Cleaner.java, AddCleanersDialog.java, EditCleanersDialog.java)
- **Jonathan Rossouw** - 601761
- **Contribution:**
- Database creation and architecture design
- SQL schema creation script and mock data generation (schema_with_mockdata.sql, ERD.jpeg)
- Video presentation editing
- **Lindokuhle Shangase** - 602395
- **Contribution:**
- Stock Issuance screen functionality (StockIssuancePnl.java, StockIssuanceController.java, StockIssuanceDAO.java, StockIssuance.java, AddStockIssuanceDialog.java, MaterialController.java)
